

# Networking

**With ever increasing bandwidth demands being placed on networks to access both local and remote applications and data, a high performance network is essential to be able to access information quickly and reliably.**

Our highly competitive range of LAN & WAN solutions, delivered over a variety of technologies, give you the opportunity to maximise the performance of your network within your budget constraints.

### Local Area Networks

We offer LAN solutions over a variety of technologies such as Cat5/6, fibre optic and wireless. Whether your requirement is to network just a few PC's within an office together or to have a whole site networked together, Platinum can design and implement the solution that is right for you. We also setup and configure the network operating environment using platforms such as Windows and Linux to ensure your applications and data are readily available, secure and backed up. Combined with our other services such as cabling, internet security & disaster recovery Platinum can provide you with a total solution.

### Wide Area Networks

Our next-generation network is based on the latest MPLS-enabled IP-VPN technology, enabling us to connect together any locations, whatever their size or geographical spread, into a secure private network. Business-grade private broadband circuits that do not transit the Internet, leased lines, LAN extension services up to 10Gb and 3G/GPRS services are sourced from the UK's leading carriers and integrated into our flexible end-to-end managed service. The service is fully managed leaving you to concentrate on running your own business.

Embedded security technology which constantly inspects the data on our network, keeps your business-critical applications and sensitive data safe. Intrusion prevention systems and managed firewalls eliminate the risks associated with both internet-based hackers and internal threats. If you do need access to the internet via the network then centralised internet transit is available from the network core giving a single point of highly secure web access for all users.
